

# Client-Fit & Idea-Tagging Logic

*How an idea is scored against a client — today's live engine, and a proposed redesign*

| Prepared                            | Scope                                      | Source of truth                      | Status                                                  |
|-------------------------------------|--------------------------------------------|--------------------------------------|---------------------------------------------------------|
| 18 June 2026<br>Amended 12 Aug 2026 | Today's Focus & Solutions<br>Views tagging | mapping.js · scanner.js<br>· data.js | §1–§2 live, see status note · §3 since built (modified) |

**The one-line truth.** There is **one** scoring engine — `mapping.js` → `scoreIdeaForClient(idea, client)` . **Both** Today's Focus and the Views tab score through it. In `scanner.js` , `ideaFit()` simply delegates to `MAPPING.scoreIdeaForClient` , and `clientsForIdea()` ranks the clients it returns. The old standalone scanner formula was deleted when the two engines were unified (commit 007131c); only a now-unused `CONV_W` export lingers. So — **one engine today, not two.**

All per-axis numbers in the worked examples below were produced by running the actual engine logic ( `mapping.js` + the synthetic 24-month sector history generated in `data.js` ) against the real seed book for **Aurora**. They are exact, not illustrative.

**Status note — amended 12 August 2026.** This document is kept as the design record of the fit engine. Three things have moved since it was prepared:

- **Naming:** the board it describes now surfaces as the **Idea Feed** in the redesigned shell ("Today's Focus" was the old tab's name); the engine underneath is the same.
- **Two engine changes landed after §1–§2 were written:** Gap fit is now **bucket-aware** — headroom is measured against the client's *derived goal vector* (a Preservation idea scores 0 once that bucket is full), falling back to the sector peg only when no goal target exists; and a bounded **goal-alignment multiplier (0.85–1.15)** now multiplies the bracketed sum before the tradability gate.
- **§3 was subsequently built, in modified form:** Preference's trajectory read became the recency-weighted **Affinity percentile** ( $\lambda = 0.94$ ); the 0.5–1.0 "goal dial" became the tamer 0.85–1.15 multiplier; the sector-peg Gap became the bucket-aware Gap; the tradability gate and inverted sector-concentration landed as proposed.

The authoritative description of the engine as it runs today is **METHODOLOGY.pdf §5–§7**; the worked examples below remain correct for the mechanics they illustrate.

## 1 · Current process — Today's Focus mapping LIVE

Today's Focus surfaces market ideas (earnings prints, structural calls) and, per idea, flags the clients it fits via `MAPPING.flagClients(idea)` . That function scores every client with `scoreIdeaForClient` , keeps those at or above the flag threshold, and returns the top few by fit.

The score is a **client-fit** number: how *right* the idea is for *this* book — deliberately separate from the idea's own conviction.

## 1.1 The four live axes

Each axis returns 0–100 and is combined with **flat (fixed) weights**. After House-view fit was removed from client-fit (moved to the conviction score) in 007131c, the original five weights were rescaled by  $1/0.85$  so the surviving four keep their relative balance and sum to **exactly 1.00**. The math uses the exact fractions; the UI shows the rounded values.

| Axis (key)                               | What it measures                                                                                                               | Formula (0–100)                                                 | Weight (exact)            | Shown       |
|------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------|---------------------------|-------------|
| <b>Gap fit</b><br>gap                    | Headroom from the book's current sector allocation up to the strategic peg.                                                    | $\max(0, (\text{peg} - \text{cur}) / \text{peg} \times 100)$    | $0.20/0.85$<br>$= 0.2353$ | 0.24        |
| <b>Affinity fit</b><br>holdings          | Recency-weighted ( $\lambda=0.94$ , 24 mo) sector affinity, minus an over-the-peg concentration penalty.                       | $\max(0, \text{ThematicAffinity} - \text{Penalty})$             | $0.25/0.85$<br>$= 0.2941$ | 0.29        |
| <b>Mandate &amp; risk</b><br>mandate     | Does the idea's vol/beta/structure and goal type suit the mandate?                                                             | $0.6 \cdot \text{RiskSuitability} + 0.4 \cdot \text{IntentFit}$ | $0.25/0.85$<br>$= 0.2941$ | 0.29        |
| <b>Conc. within sector</b><br>concSector | Herfindahl diversification of the book's in-sector names; <i>inverted</i> by default (a concentrated sector wants a new name). | $100 - (1 - \text{HHI}) \times 100$                             | $0.15/0.85$<br>$= 0.1765$ | 0.18        |
| <b>Sum of weights</b>                    |                                                                                                                                |                                                                 | <b>1.0000</b>             | <b>1.00</b> |

### Axis detail (exact, from `mapping.js`)

- **Gap fit.** `cur` = current % of the book in the idea's sector; `peg` is the strategic comfort limit by mandate class — **growth 25 / income 15 / preservation 10** (one source of truth: `PARAMS.affinity.comfort` via `sectorPeg`, shared with the Affinity penalty). At or over the peg  $\rightarrow 0$ .
- **Affinity fit.** *Thematic affinity* = recency-weighted share (month `t` weight =  $0.94^t$ ) of the trailing-24-month months whose allocation sits at or below today's — “has this book been building / sitting at the top of its range”. If the book holds the sector but no history is on file  $\rightarrow$  treated as steady  $\rightarrow \sim 100$ ; no exposure  $\rightarrow 0$ . *Penalty* = overshoot above the comfort peg, in  $\text{pp} \times 10$  (cap 100). Net =  $\max(0, \text{affinity} - \text{penalty})$ .
- **Mandate & risk.** *RiskSuitability* grades the idea's vol/beta/structure against the mandate (e.g. income mandate: low-vol  $\rightarrow 90$ , high-beta  $\rightarrow 45$ ). *IntentFit* grades the idea's goal type (appreciation / yield / protection) against the mandate's goal. Tradability is **not** on this axis any more.

- **Concentration within sector.**  $HHI = \sum(\text{in-sector weight}_i)^2$  over weights normalised to sum to 1. Raw diversification =  $(1-HHI) \times 100$ . For the fit blend it is **inverted** (`invertForFit:true`): a concentrated sector scores higher, since a new name diversifies it. No in-sector holding → neutral 50.

## 1.2 The global tradability gate

Tradability is a **binary {0,1}** multiplier over the *whole* weighted sum — not an axis:

$$\text{Final Client-Fit} = \text{Tradability} \times \sum(\text{axis}_i \cdot \text{weight}_i)$$

The model (from `data.js complexityOf`): a **Retail** client cannot trade an **OTC** natural expression (collars, forwards, OTC options). Structured *notes* are packaged securities a Retail client *can* trade; a Professional can trade any expression. The idea's “natural expression” is its first listed structure. If blocked, fit = 0 and the idea is surfaced with the MiFID reason rather than silently dropped.

## 1.3 The flag threshold

`flagClients` uses `PARAMS.flagMin = 50` and `PARAMS.flagMax = 6`: keep clients with **fit** ≥ 50, sort by fit descending, take the **top 6**. (Tiers for display: Strong ≥ 66, Good ≥ 48, else Marginal.)

## 1.4 Worked example — Micron FQ3 × Aurora

Today's Focus headline idea “**Micron FQ3 — the AI-memory print of the quarter**” (`mu-fq3`; sector Technology, bucket Growth, structures [`Phoenix autocall`, `Zero-cost collar`, `Buffered note`, `Direct equity`]) scored for **Aurora** — a **MiFID Retail**, “**Growth, with income needs**” book (parsed to **income mandate** → peg 15%).

Aurora's Technology exposure = Micron 25.8 + NVIDIA 7.2 + SAP 8.4 = **41.4%**. Synthetic 24-mo Tech history runs 6.6–43.5% with today (41.4%) just under last month's 43.5% peak.

| Axis                      | Computation                                                                                                                                                                    | Score | × Weight | = Contribution |
|---------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------|----------|----------------|
| <b>Gap fit</b>            | 41.4% Tech vs the income peg 15% — far over target, no headroom → $\max(0, (15-41.4)/15 \times 100)$ .                                                                         | 0     | 0.2353   | 0.0            |
| <b>Affinity fit</b>       | Thematic affinity <b>93</b> (only last month's 43.5% exceeds today's 41.4%) – concentration penalty <b>100</b> (26.4pp over the 15% comfort ×10, capped) = $\max(0, 93-100)$ . | 0     | 0.2941   | 0.0            |
| <b>Mandate &amp; risk</b> | $0.6 \times \text{RiskSuit } 45$ (“high-beta — too racy for an income book”) + $0.4 \times \text{IntentFit } 60$ (capital-appreciation goal vs an income mandate) = 51.        | 51    | 0.2941   | 15.0           |

|                                                                                             |                                                                                  |    |                        |     |
|---------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------|----|------------------------|-----|
| <b>Conc. within sector</b>                                                                  | 3 Tech names (MU/NVDA/SAP), HHI 0.46 → diversification 54 → inverted <b>46</b> . | 46 | 0.1765                 | 8.1 |
| <b>Bracketed weighted sum (round 15.0 + 8.1)</b>                                            |                                                                                  |    | <b>bracketFit = 23</b> |     |
| <b>Tradability gate — Retail <i>can</i> trade a Phoenix autocall (structured note) → ×1</b> |                                                                                  |    | <b>Final Fit = 23</b>  |     |

**Why Aurora is *not* flagged (23 < 50) — and why that's correct.** Aurora's signature holding *is* Micron (25.8%), yet the idea does not flag her. The engine scores **idea-fit**, not ownership: adding more Technology to a book that is **2.8× over its income-mandate sector peg** wipes out both Gap (0) and Affinity (penalised to 0), and a high-beta growth print only half-suits an income mandate (51). The whole point of Today's Focus is “who should I call about this” — and the honest answer for Aurora is “she already owns too much; this isn't an *add* for her.” The protective angle for her MU concentration is a different conversation (a collar/structure on what she holds), not a fit to buy more.

**Contrast — a Today's Focus idea that *does* flag Aurora.** The “**Gold — accumulate the pullback**” idea (gold-pullback; sector Gold, bucket Preservation, natural expression *Physical / ETC*) scores her **84** on the same engine — far above the 50 flag — because she is well *under* peg in Gold (5.2% vs 15%, Gap 65) with a clean record there (Affinity 93, no penalty). It is *nearly* identical to the Views “Gold as a debasement hedge” example in §2.2 (**82**): same Gap, Affinity and Conc-within-sector, but gold-pullback's structures include a *capital-protected note*, which reads as lower-vol and lifts **Risk Suitability to 90** (vs 82), so Mandate & risk is 80 vs 75 and the final fit is 84 vs 82.

## 2 · How the Views tab tags ideas to a client LIVE · ONE

### ENGINE

The Solutions Views tab has **no scorer of its own**. It tags ideas through the **same** `mapping.js` engine as Today's Focus (§1). In `scanner.js`, `ideaFit()` is a one-line delegate (`scanner.js:222-224`), and `clientsForIdea()` runs every client through it, keeps the ones that pass the gate, and sorts them by fit. So a Solutions View idea is scored against each client with the **identical four axes** (Affinity, Gap, Mandate & risk, Concentration-within-sector), the same **binary tradability gate**, and the same thresholds set out in §1 — there is no separate Views math.

```
// scanner.js:222-224 – ideaFit delegates; there is no second formula
function ideaFit(idea, client) {
  return window.MAPPING.scoreIdeaForClient(idea, client);
}

// scanner.js – which clients does a View idea tag?
function clientsForIdea(idea) {
  return S().clients
    .map(c => ({ client: c, ...ideaFit(idea, c) }))
    .filter(x => x.applies)           // gate: tradable && bracketFit ≥ 45
    .sort((a, b) => b.score - a.score); // rank by fit (= scoreIdeaForClient fit)
}
```

**The Views gate is `applies`, not the flag.** In the engine, `applies = tradable && bracketFit ≥ applyMin`, with `applyMin = 45`. So the Views tab tags a client when the idea is tradable for them *and* their pre-gate fit reaches 45 — a slightly looser bar than Today's Focus's **fit ≥ 50, top 6**. Same engine and same per-axis math; only the cut-off and the “top N” cap differ between the two surfaces.

### 2.1 The honest history

Before unification, `scanner.js` had its **own** standalone formula:

```
// REMOVED in 007131c – the old standalone scanner scorer
score  = secExp×1.4 + acExp×0.4 + gap×1.2 + conv
applies = secExp≥6 || acExp≥25 || gap≥6 || (protectionIncome && gap≥4)
```

That math used sector/asset-class exposure, a goal gap, and a conviction weight (`conv` from `CONV_W`), with an `applies` gate that disagreed with the 5-axis engine. Commit 007131c deleted it and pointed `ideaFit` at `MAPPING.scoreIdeaForClient`. **REMOVED** the formula · **DEAD** `CONV_W = {High:3, "Medium-High":2, Medium:1}` is still exported from `scanner.js` but nothing reads it for scoring any more — it is a vestige, not a live input.

## 2.2 Worked example — “Gold as a debasement hedge” × Aurora (Views)

The Solutions View idea “**Gold as a debasement hedge**” (gold-hedge; sector Gold, bucket Preservation, structures [Physical / ETC, Gold accumulator] → natural expression *Physical / ETC*, non-complex) scored for **Aurora** (income mandate, Gold peg 15%). Aurora holds one Gold name, **Xetra-Gold ETC at 5.2%**.

| Axis                                                                   | Computation                                                                                                                                                             | Score                  | ×<br>Weight | =<br>Contribution |
|------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------|-------------|-------------------|
| <b>Gap fit</b>                                                         | 5.2% Gold vs the income peg 15% → $(15 - 5.2) / 15 \times 100 = 65\%$ headroom to the peg.                                                                              | 65                     | 0.2353      | 15.3              |
| <b>Affinity fit</b>                                                    | Thematic affinity <b>93</b> (Gold built steadily; today's 5.2% sits near the top of its 24-mo range); 5.2% is <i>within</i> the 15% comfort → no penalty.               | 93                     | 0.2941      | 27.4              |
| <b>Mandate &amp; risk</b>                                              | $0.6 \times \text{RiskSuit } 82$ (“moderate-vol yield fits an income mandate”) + $0.4 \times \text{IntentFit } 65$ (capital-protection goal vs an income mandate) = 75. | 75                     | 0.2941      | 22.1              |
| <b>Conc. within sector</b>                                             | One Gold name → HHI 1.00 → diversification 0 → inverted <b>100</b> (a single concentrated holding — a new gold name diversifies it most).                               | 100                    | 0.1765      | 17.6              |
| <b>Bracketed weighted sum</b>                                          |                                                                                                                                                                         | <b>bracketFit = 82</b> |             |                   |
| <b>Tradability — Retail can hold Physical / ETC (non-complex) → ×1</b> |                                                                                                                                                                         | <b>Final Fit = 82</b>  |             |                   |

**Does the Views tab tag her? Yes.** bracketFit 82 ≥ applyMin 45 and the idea is tradable → applies = true, so clientsForIdea(gold-hedge) returns Aurora, ranked by her score of 82. (She also clears the stricter Today's Focus flag of 50, which is why the §1 Gold contrast also flags her.)

## 2.3 ... and a View idea the same engine does *not* tag her

Run the high-conviction Tech View “**AI infrastructure & compute leaders**” (ai-compute; sector Technology, Equity, bucket Growth, conviction High) through the same engine for Aurora — whose book is already 41.4% Technology against a 15% income-mandate peg:

| Axis                | Computation                                                                                    | Score | ×<br>Weight | =<br>Contribution |
|---------------------|------------------------------------------------------------------------------------------------|-------|-------------|-------------------|
| <b>Gap fit</b>      | 41.4% Tech vs income peg 15% — far over target, no headroom.                                   | 0     | 0.2353      | 0.0               |
| <b>Affinity fit</b> | Affinity 93 – over-peg penalty 100 (26.4pp over the 15% comfort ×10, capped) = max(0, 93–100). | 0     | 0.2941      | 0.0               |

|                                                            |                                                                                                |                       |        |      |
|------------------------------------------------------------|------------------------------------------------------------------------------------------------|-----------------------|--------|------|
| <b>Mandate &amp; risk</b>                                  | 0.6×RiskSuit 45 (high-beta — too racy for income) + 0.4×IntentFit 60 (appreciation vs income). | 51                    | 0.2941 | 15.0 |
| <b>Conc. within sector</b>                                 | 3 Tech names (MU/NVDA/SAP), HHI 0.46 → inverted.                                               | 46                    | 0.1765 | 8.1  |
| <b>bracketFit — tradable (Direct equity, Retail-OK) ×1</b> |                                                                                                | <b>Final Fit = 23</b> |        |      |

**Does the Views tab tag her? No.** bracketFit 23 < applyMin 45 → `applies = false`, so `clientsForIdea(ai-compute)` does **not** return Aurora (and 23 is well under the 50 flag too). The *old* standalone scanner formula would have tagged her hard — `secExp 41.4×1.4 + acExp 70.9×0.4 + 0 + conv 3 = 89.3`, reason “*Direct fit — holds 41.4% Technology*” — rewarding the very over-concentration the current engine penalises to zero on Gap and Affinity. **Same idea, same client, opposite verdict:** that disagreement is exactly why the two engines were unified onto `mapping.js` in 007131c.

## 3 • Proposed redesign SINCE BUILT — IN MODIFIED FORM

This section is preserved as the original design proposal — and it has since been built, in modified form (see the status note on page 1: Preference’s trajectory read became the Affinity percentile, the 0.5–1.0 goal dial became the bounded 0.85–1.15 multiplier, the sector-peg Gap became bucket-aware; the gate and inverted concentration landed as written). As proposed, it reframes the “why does this fit” signal around a **Preference** score (trajectory + house view), demotes the client’s **goal** from a weighted axis to a **dial (multiplier)**, and is explicit that **ownership and P&L never add points**.

### 3.1 The proposed components

#### Preference (0–100)

```
PREFERENCE = 0.6•Trajectory + 0.4•View
```

**Trajectory** from a 24-month series `s` (index 0 = most recent):

```
recent = mean(s[0..5]); older = mean(s[18..23]); Δ = recent - older
max(s) = 0 → 0
Δ ≥ +5 → 100
+1 ≤ Δ < +5 → 70 + (Δ-1)/4 × 30
-1 ≤ Δ < +1 → 55
-5 ≤ Δ < -1 → 20 + (Δ+5)/4 × 35
Δ < -5 → max(0, 20 + (Δ+5) × 4)
```

**View** (the house view on the name/theme):

```
LIKE → 60 + conviction × 4
NEUTRAL → 50
none → 40
AVOID → 10
```

#### Gap (0–100)

```
GAP = max(0, (peg - current) / peg × 100)    peg { growth 25, income 15, preservation
10 }
```

#### Concentration within sector

```
HHI = Σ(name weight-within-sector)2
raw = (1 - HHI) × 100
contribution = 100 - raw // invert by default
```

#### Risk suitability

|         |      |          |     |
|---------|------|----------|-----|
| Mandate | high | moderate | low |
|---------|------|----------|-----|

|                     |    |    |    |
|---------------------|----|----|----|
| <b>growth</b>       | 90 | 70 | 45 |
| <b>income</b>       | 35 | 75 | 80 |
| <b>preservation</b> | 15 | 50 | 90 |

Goal dial (0.5–1.0) — a multiplier, not an axis

| IntentMatch         | appreciation | yield | protection |
|---------------------|--------------|-------|------------|
| <b>growth</b>       | 100          | 45    | 35         |
| <b>income</b>       | 45           | 100   | 70         |
| <b>preservation</b> | 25           | 70    | 100        |

$$\text{dial} = 0.5 + 0.5 \times (\text{IntentMatch} / 100)$$
// ranges 0.5 .. 1.0

Tradability gate & composition

$$\text{Tradability} = 1 / 0$$
// Retail + OTC/complex natural expression → 0

$$\text{Base} = 0.40 \cdot \text{Preference} + 0.20 \cdot \text{Gap} + 0.15 \cdot \text{ConcContribution} + 0.25 \cdot \text{RiskSuitability}$$

$$\text{FinalFit} = \text{round}(\text{Tradability} \times \text{GoalDial} \times \text{Base}) \quad \text{flag} \geq 50$$

**Goal lives only in the dial.** Ownership and P&L never add points — preference is built from the allocation *trajectory* and the *house view*, not from whether the client holds the name or is up/down on it.

### 3.2 Worked examples (proposed)

Inputs below are illustrative (they predate the build, so they read no live data); the arithmetic shows the proposed mechanics and lands in the target bands.

**Example A — Gold → Amar (growth) → ~43 (drops off via the goal dial)**

Amar is a **growth** family office (peg 25) holding Gold at 12% — one Gold name. Gold's goal type is *protection*.

| Component          | Value | Reasoning                                                            |
|--------------------|-------|----------------------------------------------------------------------|
| Trajectory         | 55    | Long-held strategic core, roughly steady → Δ in [−1,+1).             |
| View               | 76    | House LIKES gold, conviction 4 → 60 + 4×4.                           |
| <b>Preference</b>  | 63.4  | 0.6×55 + 0.4×76 = 33 + 30.4.                                         |
| Gap                | 52    | (25 − 12)/25 × 100.                                                  |
| Conc. contribution | 100   | Single gold name → HHI 1 → 100 − 0.                                  |
| Risk suitability   | 45    | Gold is low-beta; growth×low = 45.                                   |
| <b>Base</b>        | 62.0  | 0.40×63.4 + 0.20×52 + 0.15×100 + 0.25×45 = 25.4 + 10.4 + 15 + 11.25. |

|                 |                |                                                                                                                                   |
|-----------------|----------------|-----------------------------------------------------------------------------------------------------------------------------------|
| Goal dial       | 0.675          | growth×protection IntentMatch 35 → 0.5 + 0.5×0.35.                                                                                |
| <b>FinalFit</b> | <b>≈ 42–43</b> | <b>round(1 × 0.675 × 62.0). The goal dial is what knocks a 62-point Base into the low-40s — gold doesn't serve a growth goal.</b> |

**Example B — CEG → growth client, built AI-power, down on the year → ~77**  
(stays; P&L ignored)

A **growth** client (peg 25) who has been *building* a power/utilities position (CEG — datacenter power) and is *down on the year*. CEG's goal type is *appreciation*; treat the name as a moderate-beta power play.

| Component          | Value     | Reasoning                                                                                                                                                                  |
|--------------------|-----------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Trajectory         | 100       | Allocation built up strongly over 24 mo → $\Delta \geq +5$ . <b>Note: the trajectory is the <i>weight</i> rising, not the price — being down on the year never enters.</b> |
| View               | 76        | House <b>LIKES</b> AI-power, conviction 4 → 60 + 16.                                                                                                                       |
| <b>Preference</b>  | 90.4      | $0.6 \times 100 + 0.4 \times 76 = 60 + 30.4$ .                                                                                                                             |
| Gap                | 42        | Utilities ~14.5% vs peg 25 → $(25 - 14.5) / 25 \times 100$ .                                                                                                               |
| Conc. contribution | 100       | Concentrated single power name → new name diversifies.                                                                                                                     |
| Risk suitability   | 70        | Moderate-beta power name; growth×moderate = 70.                                                                                                                            |
| <b>Base</b>        | 77.1      | $0.40 \times 90.4 + 0.20 \times 42 + 0.15 \times 100 + 0.25 \times 70 = 36.16 + 8.4 + 15 + 17.5$ .                                                                         |
| Goal dial          | 1.00      | growth×appreciation IntentMatch 100 → full dial, no penalty.                                                                                                               |
| <b>FinalFit</b>    | <b>77</b> | <b>round(1 × 1.00 × 77.1). Stays well above the flag — high preference (trajectory + view) and an on-goal idea; the loss is irrelevant.</b>                                |

**Example C — BABA → holder down hard, no bullish view → ~49/45** (drops; weak preference)

A **growth** client holds BABA, *down hard*, with *no bullish house view*. BABA's goal type is *appreciation* (dial 1.0), so the drop is driven purely by a weak **Preference** — not the loss.

| Component          | Case 1 — no view                            | Case 2 — desk says AVOID                    |
|--------------------|---------------------------------------------|---------------------------------------------|
| Trajectory         | 46.25                                       | 46.25                                       |
| View               | 40 (none)                                   | 10 (AVOID)                                  |
| <b>Preference</b>  | 43.75<br>$0.6 \times 46.25 + 0.4 \times 40$ | 31.75<br>$0.6 \times 46.25 + 0.4 \times 10$ |
| Gap                | 15                                          | 15                                          |
| Conc. contribution | 40                                          | 40                                          |

|                                |                                                                                                           |                                                               |
|--------------------------------|-----------------------------------------------------------------------------------------------------------|---------------------------------------------------------------|
| Risk suitability               | 90                                                                                                        | 90                                                            |
| <b>Base</b>                    | 49.0<br>$0.40 \times 43.75 + 0.20 \times 15 + 0.15 \times 40 + 0.25 \times 90$<br>$= 17.5 + 3 + 6 + 22.5$ | 44.2<br>$0.40 \times 31.75 + 3 + 6 + 22.5$<br>$= 12.7 + 31.5$ |
| Goal dial $\times$ Tradability | $1.00 \times 1$                                                                                           | $1.00 \times 1$                                               |
| <b>FinalFit</b>                | <b>49</b>                                                                                                 | <b>44</b>                                                     |

**Trajectory 46.25** from  $\Delta \approx -2$  (position faded as it fell):  $20 + (-2+5)/4 \times 35$ . Either way the score lands **under the 50 flag — on weak preference, not on the loss**. A neutral/absent view gives **~49**; an active AVOID pulls it to **~45**. Being down hard is *not* a factor: there is no P&L term and no ownership bonus.

## 4 · Current vs proposed — summary

**The engines are already unified.** Today's Focus and the Views tab have scored through one engine since 007131c. Unification is *not* a proposed change — it is already shipped. The genuine proposals in §3 are only the two reframings below.

| Dimension            | Current (live)                                                                                                                    | Proposed (§3)                                                                                                                                          |
|----------------------|-----------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------|
| Engine               | One engine, <code>scoreIdeaForClient</code> , shared by Today's Focus & Views<br><b>ALREADY UNIFIED</b>                           | Same single-engine principle — <b>no change</b>                                                                                                        |
| “Why it fits” signal | <b>Affinity fit</b> axis: recency-weighted sector affinity – over-peg penalty (rewards having built up / sitting at top of range) | <b>Preference</b> = 0.6·Trajectory + 0.4·View — <b>no ownership reward; P&amp;L removed</b> (trajectory is the weight's slope; view is the house call) |
| Client goal          | Folded into the <b>Mandate &amp; risk</b> axis (IntentFit, 0.4 of a 0.29-weighted axis)                                           | A <b>dial/multiplier</b> (0.5–1.0) over the whole Base — an off-goal idea is scaled down, not just lightly penalised                                   |
| Axes & weights       | 4 axes: Gap 0.24, Affinity 0.29, Mandate&Risk 0.29, ConcSector 0.18                                                               | Base from Preference 0.40, Gap 0.20, ConcContribution 0.15, RiskSuitability 0.25                                                                       |
| Tradability          | Binary global gate × weighted sum                                                                                                 | Binary global gate × dial × Base — <b>same role</b>                                                                                                    |
| Flag threshold       | Today's Focus fit ≥ 50 (top 6); Views applies ≥ 45                                                                                | FinalFit ≥ 50                                                                                                                                          |

**In one sentence:** the unification work is done; the open proposals are (1) replace the affinity/ownership signal with a **trajectory + house-view Preference** that ignores P&L, and (2) make the client's **goal a multiplier** rather than a weighted term so off-goal ideas are dialled down decisively.
